

Curriculum Big Ideas

Geography

- We are stewards of the Earth and are learning to manage it sustainably.
- There are impacts to all actions on a local and sometimes global scale.
- The landscape is always changing. It is shaped by people (human processes) and nature (physical processes)
- Inequalities exist within countries, and between countries no matter the level of development.
- Human and physical landscapes need careful management to sustain their futures.
- Geographers are curious. By asking questions and collecting data we can explain the world we live in and justify our viewpoints.
- All geography is connected to place and places will change overtime.
- A geographer will use data presented graphically, spatially or analysed statistically, to think critically and draw conclusions.
- There are impacts to all actions on a local and sometimes global scale. The choices made by past generations shape our present, and the decisions we make now will influence future generations.
- The Earth cannot be tamed, although humans try to manage the threats it poses for events which are able to be predicted.
